

Natalia Soto

801-649-7843 nataliamelissas@gmail.com LinkedIn Github

Summary

Backend software engineer with 4+ years building distributed, event-driven services and scalable APIs. Proficient in OOP (C#, Scala) with hands-on AWS and Docker experience. Experienced with JVM languages (Java, Scala), TypeScript, React, and AWS; focused on observability, API design, and end-to-end ownership

Education

Computer Science B.S. - University of Utah

Leadership: Social Media Director of Society of Women Engineers, Member of Women in Computing

Instructional Design and Educational Technology M.Ed. - University of Utah

Founder at talitech.org tutoring youth in Scratch, Python, AI, and the Software Development Life Cycle

Projects

AI Tutor: eval-gated LangGraph agent (in active development)

- Building a Socratic coding tutor in typed Python on LangGraph. Explicit state machine, Postgres-backed sessions, fallback hints, and human-on-the-loop config. Tools served over an MCP server.
- Test cases run by promptfoo in GitHub Actions on every PR, asserting no answer leakage (including jailbreak attempts), hint quality, and cost/latency budgets. Using OpenTelemetry GenAI spans.

Security Vulnerability Remediator (Ivanti)

- Automated the vulnerability remediation loop: captures security tickets from BlackDuck scans, implements fixes, iteratively tests, then commits, pushes, and opens the PR for review, replacing manual remediation.

Experience

Software Engineer II - Ivanti

South Jordan, UT | Aug 2023 - Present

- Led AI development for the my team: built LLM-powered automation (Anthropic) across code generation, testing using context engineering; drove team-wide adoption through bi-weekly engineering forums.
- Deployed a production multi-tenant backend service processing hundreds of thousands of device operations daily via Azure Service Bus, REST APIs, and MQTT.
- Optimized critical MongoDB queries ~40% through compound indexes and aggregation pipelines
- Built a native desktop chatbot for an Ivanti Hackathon using WinUI, C#, and an Ollama embedding model for retrieval (RAG), giving users immediate on-device answers to local system problems (network, slowness, firewall, port issues, etc) locally.

Software Engineer - Pluralsight

Draper, UT | Feb 2023 - Sept 2023

- Designed and shipped a production subscription checkout service on AWS using event-driven architecture and TypeScript; used New Relic for end-to-end observability.
- Built the checkout UI in React with Apollo GraphQL; optimized async rendering and cache behavior.

Software Engineer Intern (x2) - Proofpoint

Draper, UT | May 2019 - Aug 2022

- Built Python/Bash automation on Linux EC2 (AWS Cost Explorer API, MS Teams webhooks) to eliminate unused cloud resources and cut monthly AWS spend; provisioned infrastructure with Terraform and Python.
- Engineered cloud security features in Scala/GraphQL. Centralized permissions via scopes for third-party apps.

Skills

Python, TypeScript, C#, JVM (Scala), Bash, REST APIs, GraphQL, MongoDB, PostgreSQL, event-driven architecture, RBAC, OAuth, LangGraph, MCP server development, RAG/retrieval, Anthropic, Ollama, OpenCode SDK, context engineering, Docker, Terraform, AWS (Lambda, SQS, EC2), Azure Service Bus, New Relic
